Angles of a Triangle

Reading Materials

Angles of a triangle

A.R Maneesha Gnanarathna

R/Ferguson high School

## By studying this lesson you will be able to

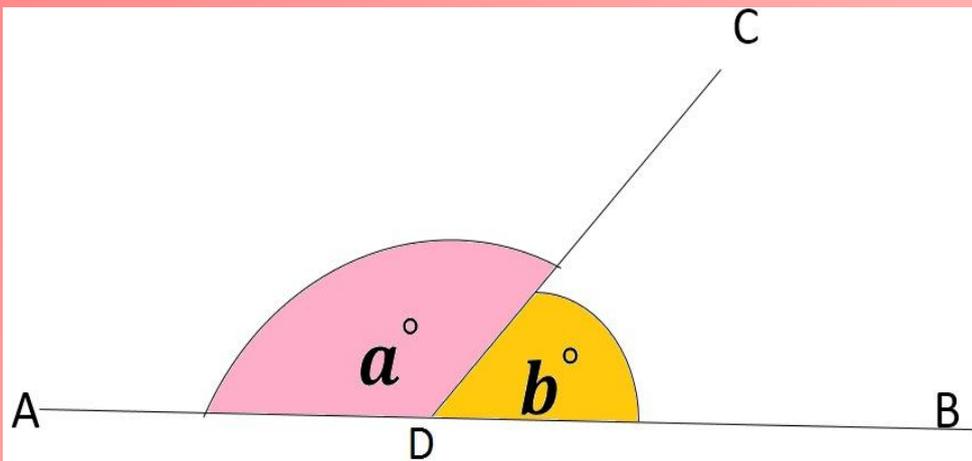

- Solve simple problems using the theorem

“The sum of the interior angles of a triangle is  $180^\circ$ ”

- Solve simple problems using the theorem

“The exterior angles of a triangle is equal to the sum of the interior opposite angles.”

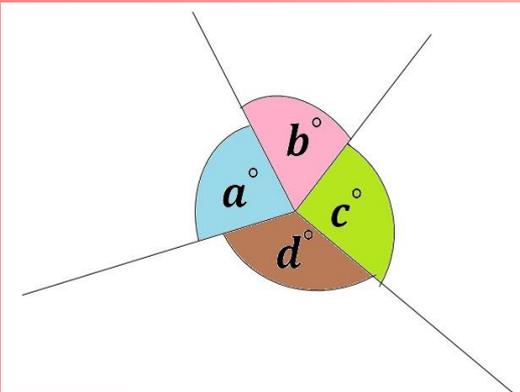

- . A pair of adjacent angles on a straight line are supplementary

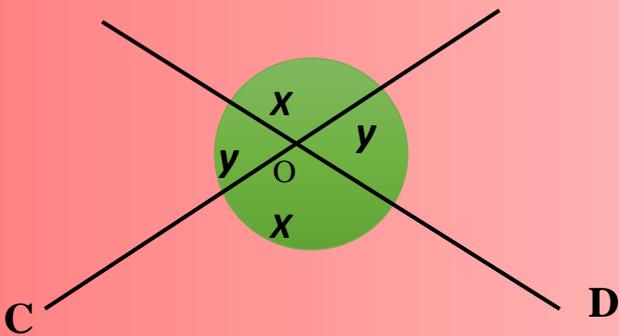

$$a + b = 180^\circ$$

□ The sum of the angles around a point is  $360^\circ$

$$a + b + c + d = 360^\circ$$

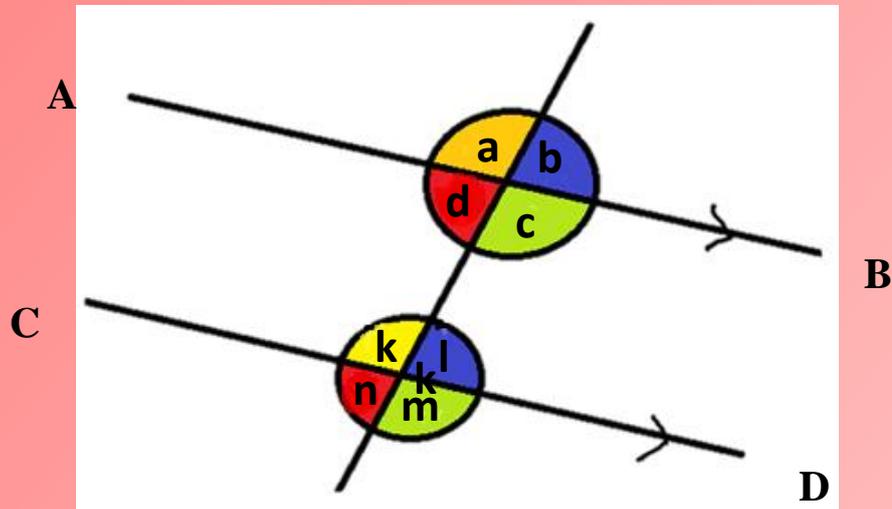

□ The vertically opposite angles formed by the intersection of two straight lines are equal

$$\hat{AOD} = \hat{COB}$$

$$\hat{AOC} = \hat{BOD}.$$

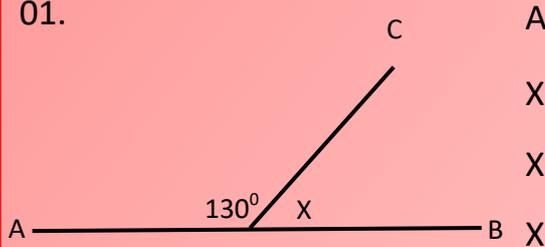

## □ Angles related to Parallel lines

- $AB \parallel CD$
- $c = k, d = l$  (Alternate angles)
- $a = k, b = l, c = m, d = n$  (Corresponding angles)
- $d + k = 180^\circ$  and  $c + l = 180^\circ$  (Allied angles)

### Example

01.

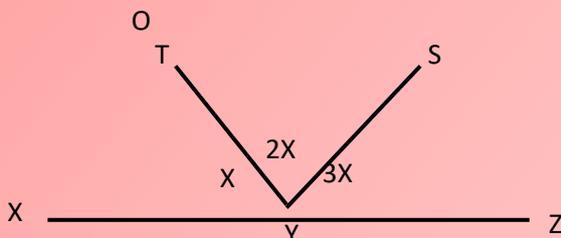

AOB is a straight line.

$$X + 130 = 180 \text{ (Adjacent angles of a straight line)}$$

$$X = 180 - 130$$

$$X = 50^\circ$$

02.

Find the value of x.

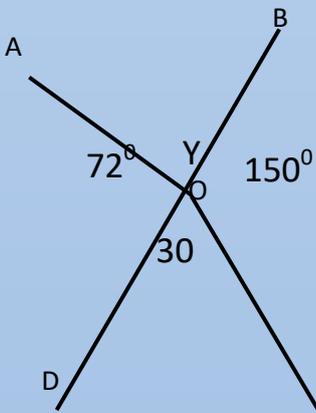

$$X + 3X + 2X = 180$$

$$6X = 180$$

$$6X / 6 = 180 / 6$$

$$X = 30^\circ$$

03.

Find the value of  $\hat{A}OB$ .

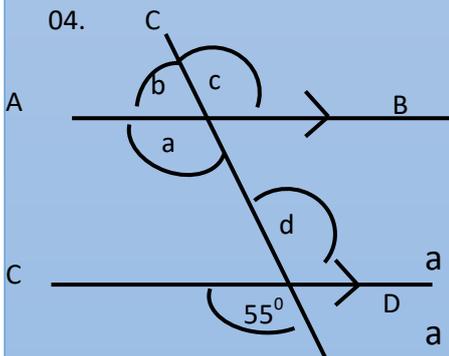

$$72 + 30 + 150 + Y = 360 \text{ (Angles around at a point)}$$

$$278^\circ + Y = 360$$

$$Y = 360 - 278$$

$$Y = 82^\circ$$

04.

Find the magnitude of the angles denoted by the algebraic terms using the information given in the figure.

$$a = 55^\circ \text{ (corresponding angles, } AB \parallel CD)$$

$$a = d = 55 \text{ (Alternate angles, } AB \parallel CD)$$

$$a = b = 55 \text{ (Allied angles)}$$

$$a + b = 180 \text{ (Adjacent angles on a straight line)}$$

$$55 + b = 180$$

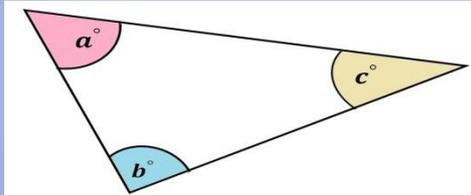

$$b = 180 - 55$$

$$b = 125^\circ$$

Do the review exercise in page number 85 and 86 in your text book.

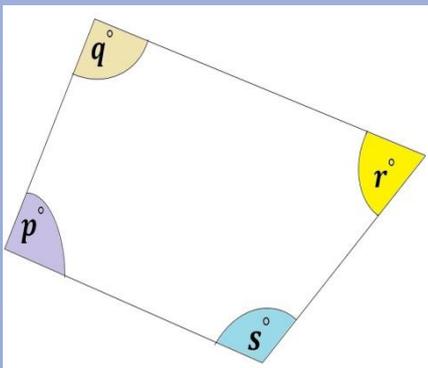

- The sum of the interior angles of a triangle is  $180^\circ$

$$a + b + c = 180^\circ$$

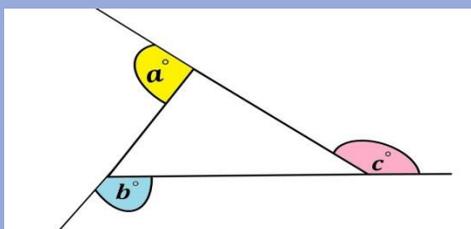

- . The sum of the interior angles of a quadrilateral is  $360^\circ$

$$p + q + r + s = 360^\circ$$

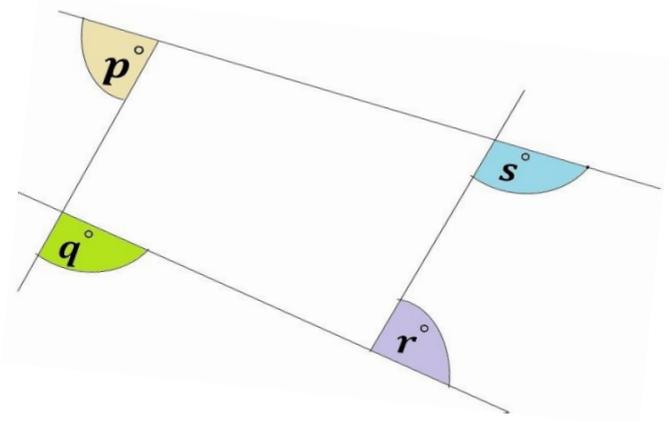

- The sum of the exterior angles of a triangle is  $360^\circ$

$$a + b + c = 360^\circ$$

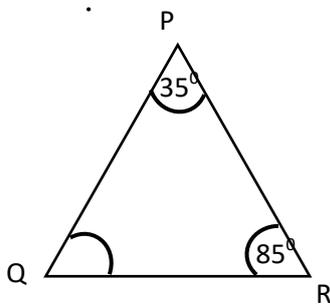

□ The sum of the exterior angles of a quadrilateral is  $360^\circ$

$$p+q+r+s = 360^\circ$$

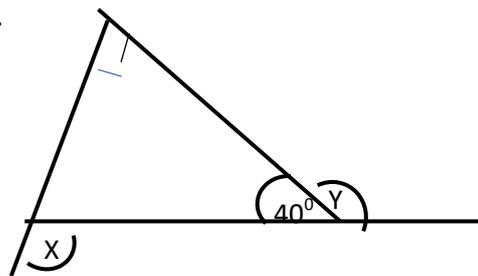

### Examples

01. Find the value of PQR angle using the information provided

$$\begin{aligned} 35 + 85 + \hat{PQR} &= 180 \text{ (Interior angles of a triangle)} \\ 120 + \hat{PQR} &= 180 \\ \hat{PQR} &= 180 - 120 \\ \hat{PQR} &= 60^\circ \end{aligned}$$

02 Find the magnitude of x and y using the informations provided in the following figure.

i.  $Y + 40 = 180$  (Adjacent angles on a straight line)

$$Y = 180 + 40$$

$$Y = 140^\circ$$

ii.  $x + Y + 90 = 360$  (Exterior angles of a triangles)

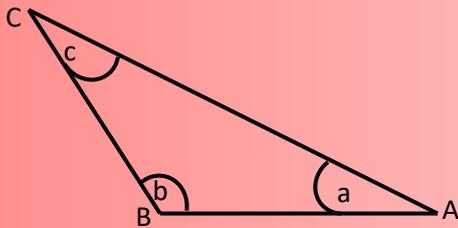

$$X + 140 + 90 = 360$$

$$X + 230 = 360$$

$$X = 360 - 230$$

$$X = 130^\circ$$

### Interior angles of a Triangle

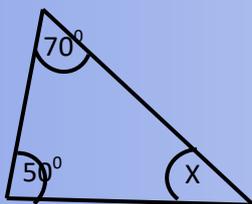

Theorem:

The Sum of the three interior angles of a Triangle is  $180^\circ$

$$\hat{A} + \hat{B} + \hat{C} = 180^\circ$$

Example

i.

Find the value of X.

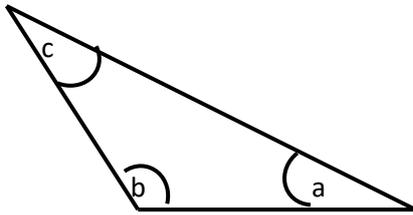

$$50 + 70 + X = 180 \text{ (Interior angles of a triangle)}$$

$$120 + X = 180$$

$$X = 180 - 120$$

$$X = 60^\circ$$

02

$$X + 3X + 2X = 180 \text{ (Interior angles of a Triangle)}$$

$$6X = 180$$

$$6X / 6 = 180 / 6$$

$$X = 30^\circ$$

03 The ratio between two interior angles of a triangle is 1:3 .sum of the two interior angles are  $128^\circ$ . Find the value of three angles separately.

if the two angles are a and b

$$\text{Ratio between a and b} = 1:3$$

$$\text{sum of the parts} = 1 + 3$$

$$= 4$$

$$\text{Magnitude of angle a} = \frac{1}{4} * 128^\circ$$

$$= 32^\circ$$

$$\text{Magnitude of angle b} = \frac{3}{4} * 128^\circ$$

$$= 96^\circ$$

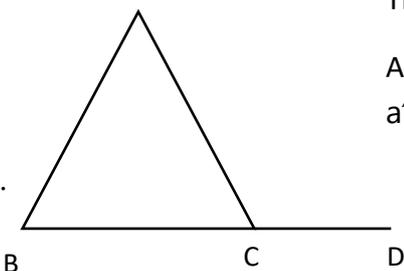

$$\text{Magnitude of the remaining angle} = 180^\circ - (128^\circ)$$

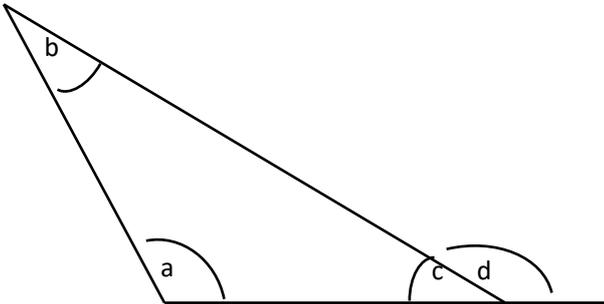

$$= 52^\circ$$

## Exterior angles of a Triangle

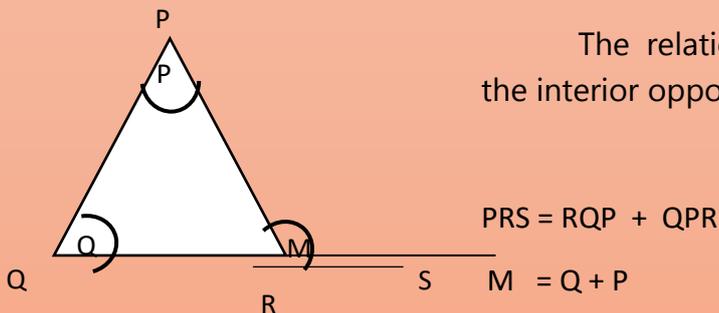

The side BC has produced up to D in the triangle .

ACD is the exterior angle of the triangle. The interior opposite angles relevant to the exterior angle  $\hat{ACD}$  are  $\hat{CAB}$  and  $\hat{ABC}$ .

- The interior angle relevant to the exterior angle  $d$  are  $a$  and  $b$

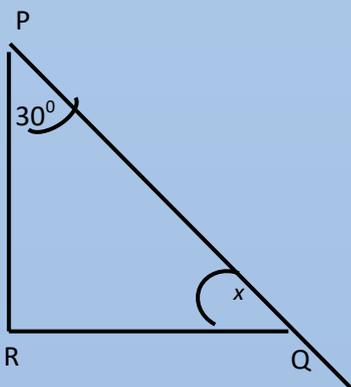

The relationship between the exterior angle and the interior opposite angles can be given as follow.

### Theorem

If a side of a triangle is produced, the exterior angle so formed is equal to the sum of the two interior opposite angles.

### Examples

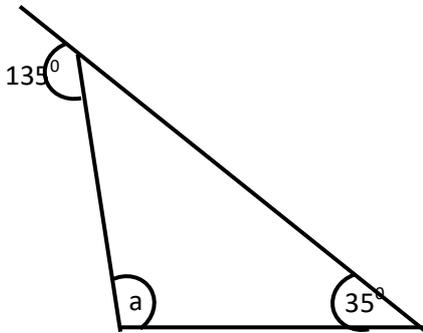

In PQR Triangle PQ side has produced up to S

$x$  is the exterior angle in triangle PQR

$$x = 90 + 30$$

$$x = 120^\circ$$

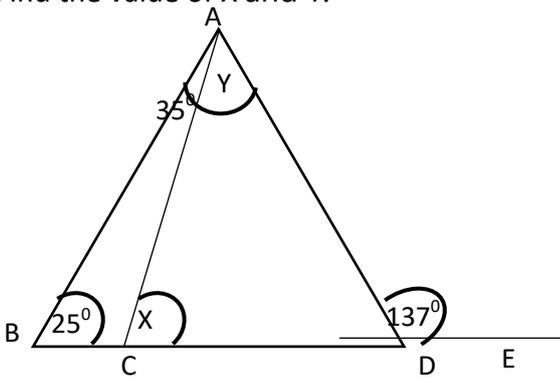

Find the Value of a

$$135 - 35 = a$$

$$100^\circ = a$$

Find the value of X and Y.

In  $\triangle ABC$

$$X = 25 + 35$$

$$X = 60^\circ$$

ACD  $\triangle$

$$137 = X + Y$$

$$137 = 60 + Y$$

$$137 - 60 = Y$$

$$77^\circ = Y$$
