

7. One mole of  $N_2H_4$  forms the compound Y by removing 10 moles of electrons. If all the "N" atoms in the initial compound are present in compound Y, what is the oxidation number of a "N" atom in Y?  
 (1) -3                      (2) -2                      (3) +1                      (4) +3                      (5) +5
8. Which of the following gives the electron pair geometry and hybridisation around an oxygen atom in  $H_2O_2$  respectively?  
 (1) angular,  $sp^3$                       (2) tetrahedral,  $sp^3$                       (3) tetrahedral,  $sp^2$   
 (4) angular,  $sp$                       (5) linear,  $sp$
9. What is the molar ratio between ethanol ( $C_2H_5OH$ ), and  $KMnO_4$  when ethanol is oxidised to acetic acid ( $CH_3COOH$ ) by  $KMnO_4$  in acid medium?  
 (1) 3 : 2                      (2) 1 : 5                      (3) 4 : 5                      (4) 2 : 5                      (5) 5 : 4
10. When a sample of an alloy containing magnesium and aluminium in the molar ratio 1: 2 was reacted with excess hydrochloric acid, the volume of gas liberated under STP was  $89.6 \text{ dm}^3$ . What is the mass of aluminium in the sample of the alloy? (The molar volume of a gas at STP is  $22.4 \text{ dm}^3\text{mol}^{-1}$ .  $Mg = 24$ ,  $Al = 27$ )  
 (1) 54.0 g                      (2) 72.0 g                      (3) 81.0 g                      (4) 105.0 g                      (5) 108.0 g
11. Which of the following does **not** show stereoisomerism?  
 (1)  $CH_2 = \underset{\substack{| \\ OH}}{CH} - CH_3$                       (2)  $CH_3CH = CH - CH_2OH$   
 (3)  $CH_3 - \overset{\substack{| \\ CH_3}}{CH} - CH_2OH$                       (4)  $CH_3CH_2 - \underset{\substack{| \\ OH}}{CH} - CH_3$   
 (5)  $CH_3 - \overset{\substack{| \\ H}}{C} = \overset{\substack{| \\ OH}}{C} - CH_3$
12. The ascending order of the boiling point of the following compounds is,  
 (1)  $SiH_4 < PH_3 < H_2S < HCl$                       (2)  $SiH_4 < PH_3 < HCl < H_2S$   
 (3)  $HCl < H_2S < SiH_4 < PH_3$                       (4)  $HCl < H_2S < PH_3 < SiH_4$   
 (5)  $H_2S < HCl < PH_3 < SiH_4$
13. Which of the following is the suitable expression for the solubility of solid  $Ag_2CrO_4$  in a  $y \text{ mol dm}^{-3}$  aqueous  $Na_2CrO_4$  solution? ( $K_{sp}$  means the solubility product of  $Ag_2CrO_4$ ).  
 (1)  $(K_{sp})^{1/3}$                       (2)  $\left(\frac{K_{sp}}{4}\right)^{1/2}$                       (3)  $\left(\frac{K_{sp}}{4y}\right)^{1/2}$                       (4)  $\left(\frac{K_{sp}}{2y}\right)^{1/2}$                       (5)  $\left(\frac{K_{sp}}{y}\right)^{1/3}$
14. At room temperature, the vapour pressure of pure A is twice the vapour pressure of pure B. What is the mole fraction of A in the vapour in equilibrium with a binary solution in which the molar ratio of A : B is 3 : 2 (Assume that the solution behaves ideally.)  
 (1) 0.25                      (2) 0.30                      (3) 0.50                      (4) 0.75                      (5) 0.80
15. Which of the following is **not** oxidised by acidified  $K_2Cr_2O_7$ ?  
 (1)  $CH_3CH_2OH$                       (2)  $H_2S$                       (3)  $Br_2$                       (4)  $NaBr$                       (5)  $H_2O_2$
16. A green coloured aqueous solution contains two sodium salts comprising two 'd' block elements. The solution, on addition of a solution of  $H_2O_2$  gives a brown precipitate and a yellow solution. Which of the following would be the two 'd' block elements contained in the salts of the initial solution?  
 (1) Fe and Mn                      (2) Mn and Ni                      (3) Fe and Ni                      (4) Cr and Ni                      (5) Mn and Cr

17. If the numerical value of the equilibrium constant of equilibrium  $\text{N}_2(\text{g}) + 2\text{O}_2(\text{g}) \rightleftharpoons 2\text{NO}_2(\text{g})$  at a certain temperature is 100, what is the numerical value of the equilibrium constant of the equilibrium  $\text{NO}_2(\text{g}) \rightleftharpoons \frac{1}{2}\text{N}_2(\text{g}) + \text{O}_2(\text{g})$ ?
- (1) 0.01                      (2) 0.10                      (3) 10.0                      (4) 25.0                      (5) 50.0

18. Consider the following statements about  $\text{NH}_3$ .

A - The conjugate acid of  $\text{NH}_3$  is  $\text{NH}_4^+$ .

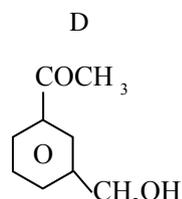

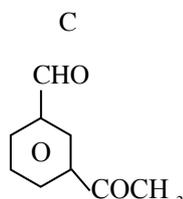

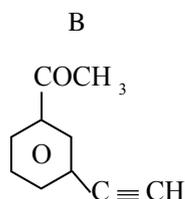

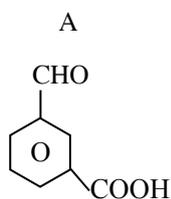

B -  $\text{NH}_2^-$  is the conjugate base of  $\text{NH}_3$ .

C -  $\text{NH}_3$  is formed by the reaction between  $\text{NH}_4\text{NO}_3$  and  $\text{NaNH}_2$ .

D - Ammonia cannot act as an oxidising agent as the N in  $\text{NH}_3$  exists in the lowest oxidation state.

Of the above, the true statements are

- (1) only A and B.                      (2) only B and C.                      (3) only C and D.  
 (4) only A, B and C.                      (5) all A, B, C and D.
19. The organic compound X gives an orange coloured precipitate with Brady's reagent and reduces Tollen's reagent. Which of the following would be X?

- (1) only A                      (2) only A and C.                      (3) only B and D.  
 (4) only C and D.                      (5) only A, B and C.
20. What is the pH of the solution formed when  $100 \text{ cm}^3$  of a  $0.1 \text{ mol dm}^{-3} \text{ H}_2\text{SO}_4$  solution were mixed with  $100 \text{ cm}^3$  of a  $0.4 \text{ mol dm}^{-3} \text{ KOH}$  solution at  $25^\circ\text{C}$ ? ( $K_w$  at  $25^\circ\text{C} = 10^{-14} \text{ mol}^2 \text{ dm}^{-6}$ )
- (1) 10.0                      (2) 11.0                      (3) 12.0                      (4) 12.5                      (5) 13.0

21. The solid A introduced into a closed system comes to the following equilibrium when heated to a certain temperature.

Which of the following gives the equilibrium partial pressure of  $\text{B}(\text{g})$  in this system?

- (1)  $\frac{Kp}{5}$                       (2)  $(Kp)^{\frac{1}{2}}$                       (3)  $\frac{Kp}{3}$                       (4)  $\left(\frac{Kp}{4}\right)^{\frac{1}{2}}$                       (5)  $\left(\frac{Kp}{2}\right)^{\frac{1}{2}}$

22. What is the temperature change occurring when  $100 \text{ cm}^3$  of a  $1.0 \text{ mol dm}^{-3} \text{ NaOH}$  solution were mixed with  $100 \text{ cm}^3$  of a  $\text{HCl}$  solution of the same concentration in a thermally insulated container?

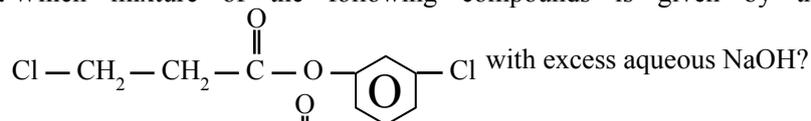

Standard enthalpy of neutralisation =  $-57 \text{ kJ mol}^{-1}$

Specific heat capacity of the solution =  $4.2 \text{ J g}^{-1} \text{ K}^{-1}$

Density of the solution =  $1.0 \text{ g cm}^{-3}$

- (1)  $3.0^\circ\text{C}$                       (2)  $4.2^\circ\text{C}$                       (3)  $5.6^\circ\text{C}$                       (4)  $6.8^\circ\text{C}$                       (5)  $8.2^\circ\text{C}$
23. A buffer solution of pH 4 is formed when  $50.0 \text{ cm}^3$  of a  $0.2 \text{ mol dm}^{-3}$  solution of a weak monobasic acid HA are mixed with  $50.0 \text{ cm}^3$  of a solution of its sodium salt NaA. If  $K_a$  of HA at the relevant temperature is  $1.0 \times 10^{-6} \text{ mol dm}^{-3}$ , what is the concentration in  $\text{mol dm}^{-3}$  of the NaA solution mixed?
- (1)  $1.0 \times 10^{-3}$                       (2)  $2.0 \times 10^{-3}$                       (3)  $1.0 \times 10^{-2}$                       (4)  $1.5 \times 10^{-2}$                       (5)  $4.0 \times 10^{-2}$

24. Which mixture of the following compounds is given by the reaction between the compound

- (1)  $\text{Cl}-\text{CH}_2-\text{CH}_2-\overset{\text{O}}{\parallel}{\text{C}}-\text{ONa} + \text{HO}-\text{C}_6\text{H}_4-\text{Cl}$
- (2)  $\text{HO}-\text{CH}_2-\text{CH}_2-\overset{\text{O}}{\parallel}{\text{C}}-\text{ONa} + \text{NaO}-\text{C}_6\text{H}_4-\text{Cl}$
- (3)  $\text{HO}-\text{CH}_2-\text{CH}_2-\overset{\text{O}}{\parallel}{\text{C}}-\text{ONa} + \text{HO}-\text{C}_6\text{H}_3(\text{OH})-\text{Cl}$
- (4)  $\text{HO}-\text{CH}_2-\text{CH}_2-\overset{\text{O}}{\parallel}{\text{C}}-\text{OH} + \text{HO}-\text{C}_6\text{H}_3(\text{OH})-\text{OH}$
- (5)  $\text{HO}-\text{CH}_2-\text{CH}_2-\overset{\text{O}}{\parallel}{\text{C}}-\text{ONa} + \text{HO}-\text{C}_6\text{H}_3(\text{OH})-\text{OH}$

25. A is a coloured inorganic salt insoluble in water. When a few of solid A is dissolved in excess of hydrochloric acid a colourless gas G is liberated giving a yellow solution Q. When Q is diluted with water, first it turns green and finally blue. The gas G when passed into bromine water turns bromine water colourless giving the solution T. On addition of barium chloride solution, T gives a white precipitate P which is insoluble in nitric acid. Which of the following could be A?

- (1)  $\text{CuBr}_2$                       (2)  $\text{CuCO}_3$                       (3)  $\text{NiSO}_3$                       (4)  $\text{CuSO}_3$                       (5)  $\text{CuSO}_4$

26. Of the following, the pair of ions that **cannot** be distinguished by passing  $\text{H}_2\text{S}$  in an ammoniacal medium is

- (1)  $\text{Zn}^{2+}, \text{Ni}^{2+}$                       (2)  $\text{Mg}^{2+}, \text{Cd}^{2+}$                       (3)  $\text{Cu}^{2+}, \text{Bi}^{3+}$   
 (4)  $\text{Cr}^{3+}, \text{Co}^{2+}$                       (5)  $\text{Zn}^{2+}, \text{Co}^{2+}$

The reaction 1 and 2 above are first order reactions. When  $t = 0$ ,  $[\text{A}] = [\text{P}]$ . When  $t = 12$  seconds,  $[\text{A}] = 2[\text{P}]$ . The half lives of A and P relevant to the reactions 1 and 2 respectively in seconds are

- (1) 2 and 3.                                      (2) 4 and 3.                                      (3) 3 and 4.  
 (4) 6 and 8.                                      (5) 3 and 2.

28. Contained in a vessel of volume  $4.157 \text{ dm}^3$  are 0.01 moles of He,  $\text{O}_2$  and Mg each at 300 K. What will be the total pressure of the vessel if all the magnesium is burnt completely and the vessel is brought to the initial condition?

- (1)  $6.0 \times 10^3 \text{ Pa}$   
 (2)  $7.5 \times 10^3 \text{ Pa}$   
 (3)  $8.0 \times 10^3 \text{ Pa}$   
 (4)  $9.0 \times 10^3 \text{ Pa}$   
 (5)  $18 \times 10^3 \text{ Pa}$

29. In which of the following reaction is a compound with two asymmetric carbon atoms are formed?

- (1) Addition of a dilute alkali to  $\text{CH}_2 = \text{CHCH}_2\text{CH}_2\text{Cl}$
- (2) Reacting  $\text{CH}_3\overset{\text{O}}{\parallel}{\text{C}}(\text{CH}_3)_3$ , with Zn/Hg and concentrated HCl
- (3) Reacting  $\text{CH}_3\text{CH}_2 - \overset{\text{O}}{\parallel}{\text{C}} - \text{H}$  with HCN
- (4) Addition of  $\text{Br}_2$  to  $\text{CH}_3\text{CH}_2\text{CH} = \text{CH}_2$
- (5) Addition of dilute NaOH to  $\text{CH}_3\text{CH}_2\text{CHO}$

30. You are provided with  $100 \text{ cm}^3$  of ether to extract the insecticide X contained in  $100 \text{ cm}^3$  of an aqueous solution. If the volume of ether was used in two successive equal extractions, what is the percentage of X left in the aqueous solution at the end? (Distribution coefficient of X between ether and water is 18).

- (1) 1.0 %                      (2) 2.0 %                      (3) 5.0 %                      (4) 10.0 %                      (5) 20.0 %

• For each of the questions 31 to 40, one or more responses out of the four responses (a), (b), (c) and (d) given is / are correct. Select the correct response / responses. In accordance with the instructions given on your answer sheet, mark

- (1) if only (a) and (b) are correct.
- (2) if only (b) and (c) are correct.
- (3) if only (c) and (d) are correct.
- (4) if only (d) and (a) are correct.
- (5) if **any other** number of combinations or response is correct.

**Summary of above instructions**

1	2	3	4	5
only (a) and (b) are correct	only (b) and (c) are correct	only (c) and (d) are correct	only (d) and (a) are correct	<b>Any other</b> number of responses or combination is correct.

31. Consider the following system in dynamic equilibrium.

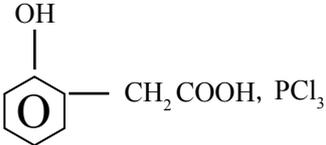

Which of the following statement(s) is / are correct about the probable changes in the above system when a little of A is removed at constant temperature?

- (a) Rate of the forward reaction decreases.      (b) Rate of the backward reaction increases.  
 (c) Value of  $K_p$  decreases.                              (d) Concentration of B increases.

32. Which of the following is correct about  $[\text{Co}(\text{NH}_3)_4(\text{NO})\text{Cl}]\text{SO}_4$ ?

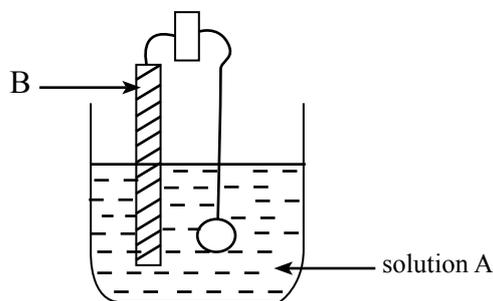

- (a) The co-ordination number of Co in it is 6.
- (b) It is colourless in aqueous solution.
- (c) The oxidation number of Co in it is +2.
- (d) It gives a white precipitate with an aqueous solution of  $\text{BaCl}_2$ .

33. Which of the following statement(s) is/ are true regarding polymers?
- Nylon-6,6 is a condensation polymer and is thermostable.
  - The building unit of natural rubber is 2- methylbuta-1,3-diene.
  - Polyester is a linear polymer and is thermoplastic.
  - Teflon is a condensation polymer and is thermostable.
34. In some carbon chains, when there are two functional groups which can react with one another, cyclic molecules are formed by the reaction between them. The reactions between which of the following would give rise to the formation of such cyclic molecules?
- 
  - HOCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub> , PCC
  - $$\text{H} - \overset{\text{O}}{\parallel}{\text{C}} - \text{CH}_2\text{CH}_2\text{CH}_2 - \overset{\text{O}}{\parallel}{\text{C}} - \text{NH}_2$$
, (i) LiAlH<sub>4</sub> (ii) H<sub>2</sub>O
  - BrCH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>C≡C - H , NaNH<sub>2</sub>
35. Consider the electrochemical cell constructed by the electrodes of metals X and Y under standard conditions. If  $E^\circ_{\text{Y}^{2+}/\text{Y}} = -0.14 \text{ V}$  and  $E^\circ_{\text{X}^{2+}/\text{X}} = 2.57 \text{ V}$ , which of the following statement(s) is / are true?
- In this cell, electrons flow from X electrode to Y electrode.
  - Oxidation takes place at Y.
  - X electrode is the cathode.
  - In this cell,  $E^\circ_{\text{cell}} = 2.23 \text{ V}$ .
36. Consider the reaction  $\text{A}(\text{g}) + \text{B}(\text{g}) \longrightarrow \text{C}(\text{g}) + \text{D}(\text{g})$ . For some concentrations of A and B, the initial rate of the reaction is r. When the concentration of A is doubled keeping the concentration of B constant, the rate becomes 2r while when the concentration of B is doubled keeping the concentration of A constant, the rate becomes 4r. Which of the following is / are true about this reaction?
- It is a first order reaction with respect to B.
  - The rate of consumption of B is greater than the rate of consumption of A.
  - It **cannot** be a one-step reaction.
  - Its overall order is 3.
37. Which of the following statement(s) is /are true about the nitration of benzene and its derivatives?
- It is an electrophilic addition reaction.
  - Toluene undergoes nitration faster than benzene.
  - The intermediate carbocations formed in these reactions are stabilised by the delocalisation of their positive (+) charge.
  - Chlorobenzene undergoes nitration faster than benzene.
38. Which of the following statement(s) is / are true about the chemistry of compounds containing nitrogen?
- NH<sub>3</sub> can act as a weak base as well as an acid.
  - An acid and a base are formed by the hydrolysis of NCl<sub>3</sub>.
  - N<sub>2</sub>O can be prepared by heating a mixture of NH<sub>4</sub>Cl and NaNO<sub>3</sub>.
  - HNO<sub>2</sub> and HNO<sub>3</sub> are two very strong oxoacids formed by nitrogen.

39. What is / are the product (s) formed when sulphur is reacted with aqueous NaOH?

- (a)  $\text{Na}_2\text{S}$                       (b)  $\text{Na}_2\text{SO}_4$                       (c)  $\text{H}_2\text{O}$                       (d)  $\text{Na}_2\text{S}_2\text{O}_3$

40. It is expected to deposit a very high quality silver plating on an iron ring using the following set up. Which of the following statement(s) is / are true with regard to that process?

- (a) The ring should be connected to the positive terminal of the supply cell.  
 (b)  $[\text{Ag}(\text{NH}_3)_2]\text{NO}_3$  solution is more suitable than a  $\text{AgNO}_3$  solution for A.  
 (c) The ratio of the current used to the surface area of the ring should be small.  
 (d) Iron should be used in place of B.

	First Statement	Second Statement
41.	$\text{CH}_3\text{NH}_2$ reacts with $\text{CH}_3\text{MgCl}$ .	$\text{CH}_3\text{NH}_2$ can act as a base.
42.	$\text{CH}_3\text{CH}_2\text{Cl}$ is formed when $\text{CH}_3\text{COCl}$ is reduced by $\text{LiAlH}_4$ .	$\text{LiAlH}_4$ can be used to reduce carboxylic acid derivatives.
43.	In the Solvay process of producing $\text{Na}_2\text{CO}_3$ , $\text{NH}_3$ gas is passed through brine saturated with $\text{CO}_2$ .	The solubility of $\text{NH}_3$ in an aqueous solution saturated with $\text{CO}_2$ is greater than the solubility of $\text{NH}_3$ in water at that temperature.
44.	$\text{CH}_2=\text{CHCH}_2\text{Br}$ shows a greater tendency to undergo single step nucleophilic substitution reactions.	$\text{CH}_2=\text{CHCH}_2\text{Br}$ is a primary alkyl halide.
45.	The solubility of an ionic compound in water depends on the hydration enthalpy and lattice enthalpy of its ions.	As the standard lattice enthalpy is greater than the sum of the standard hydration enthalpies of the relevant ions, the standard enthalpy of solution of an ionic compound in water is always exothermic.
46.	When temperature increases, $K_p$ of the equilibrium $\text{CaCO}_3(\text{s}) \rightleftharpoons \text{CaO}(\text{s}) + \text{CO}_2(\text{g})$ increases.	When the temperature of the equilibrium system $\text{CaCO}_3(\text{s}) \rightleftharpoons \text{CaO}(\text{s}) + \text{CO}_2(\text{g})$ in a constant volume container is increased, the pressure increases.
47.	The solubility of $\text{Mg}(\text{OH})_2$ in a solution prepared by dissolving solid $\text{Fe}(\text{OH})_2$ in water is much less than the solubility of $\text{Mg}(\text{OH})_2$ in water at that temperature.	The solubility of an ionic compound in an aqueous solution containing a common ion is always less than the solubility of that ionic compound in water at that temperature.
48.	When a little of aqueous $\text{HBr}$ acid is added to an excess of an aqueous solution of $\text{NaF}$ , a buffer system is obtained.	In aqueous solution, $\text{HF}$ is a weak acid and $\text{HBr}$ is a strong acid.
49.	The critical temperature of $\text{NH}_3$ gas is greater than the critical temperature of $\text{CO}_2$ gas.	The attractive forces among $\text{NH}_3$ molecules are stronger than the attractive forces among the $\text{CO}_2$ molecules.
50.	A slurry of $\text{MgO}$ can be used to scrub the acidic gases emitted by industries.	An aqueous solution of $\text{MgO}$ shows strong basic properties.

**Chemistry II**

**Three hours**

## Part A - Structured Essay

\* Answer **all four** questions on this paper itself.

\* Each question carries **10** marks.

Universal gas constant  $R = 8.314 \text{ J K}^{-1} \text{ mol}^{-1}$

Avogadro constant  $N_A = 6.022 \times 10^{23} \text{ mol}^{-1}$

Planck's constant  $h = 6.626 \times 10^{-34} \text{ J s}$

Velocity of light  $c = 3 \times 10^8 \text{ m s}^{-1}$

1. (a) Q, R and T are three consecutive elements belonging to the p block of the Periodic Table while X, Y and Z are three consecutive elements belonging to the d block of the Periodic Table. The relative atomic mass of all these elements is below 60. The formulae of oxoanions corresponding to the highest oxidation states of elements T and Z are  $\text{TO}_4^-$  and  $\text{ZO}_4^-$  respectively. Fill in the blanks of the following sentences.

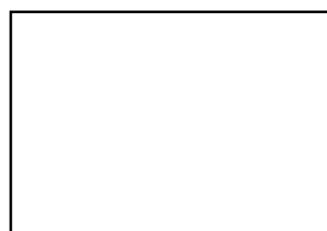

- (i) The true symbol of element X is .....
- (ii) The ions  $\text{TO}_4^-$  and  $\text{ZO}_4^-$  have..... shapes.
- (iii) A solution of ..... ions can be used to determine the concentration of  $\text{ZO}_4^-$  ions in a solution volumetrically.
- (iv) The highest oxidation state of R is.....
- (v) A solution of ..... ions can be used to determine the concentration of a solution containing oxoanions corresponding to the highest oxidation state of element R gravimetrically.
- (vi) A solution of  $\text{TO}_4^-$  ions can be obtained by dissolving the oxide of formula ..... in water.
- (vii) The first ionization energy of Q is ..... than the first ionization energy of R.
- (viii) As regards the acidic, basic, amphoteric and neutral properties, the oxide corresponding to the highest oxidation state of X is .....

**(2.4 marks)**

(b) (i) Draw the Lewis structures of the oxalate ion ( $\text{C}_2\text{O}_4^{2-}$ ) and the dinitrogen tetroxide molecule ( $\text{N}_2\text{O}_4$ ).

$\text{C}_2\text{O}_4^{2-}$

$\text{N}_2\text{O}_4$

- (ii) Based on the above structures, explain why the oxalate ion stays stable whereas  $N_2O_4$  easily dissociates into nitrogen dioxide ( $NO_2$ ).

.....  
.....  
.....  
.....

(1.9 marks)

- (c) J and K are two non – metallic elements placed adjacently in the same group of the p block. J forms a triatomic molecule of molecular formula  $J_3$  while J and K form a compound of molecular formula  $KJ_2$ .  $J_3$  and  $KJ_2$  molecules are similar in shape.

- (i) Identify the elements J and K.

**J** - .....

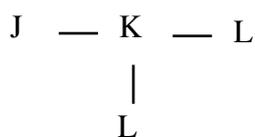

**K** - .....

- (ii) What is the shape of the molecules  $J_3$  and  $KJ_2$  ?

.....

- (iii) Draw the resonance (canonical) structures of the  $J_3$  molecule.

- (iv) The electronegativity of element L is greater than the electronegativity of J. The elements K, J and L form a molecule having the following skeleton.

Using true symbols,

- (I) draw the most acceptable Lewis structure of the above molecule.

- (II) state electron pair geometry around the K atom of the above molecule.

.....

- (III) state the shape around the K atom of the above molecule.

.....

(IV) draw **four** canonical structures for the molecule.

(4.5 marks)

(d) (i) Arrange the following compounds in the ascending order of their covalent character.

MgBr<sub>2</sub>, CaCl<sub>2</sub>, BaF<sub>2</sub>, BaCl<sub>2</sub>

.....

(ii) Arrange the following compounds in the ascending order of their solubility in water.

NaOH, Al(OH)<sub>3</sub>, Ca(OH)<sub>2</sub>, Ba(OH)<sub>2</sub>

.....

(1.2 marks)

(Total 10.0 marks)

2. (a) The boiling point of the inorganic compound X which exists as a colourless liquid at room temperature is higher than that of water. When exposed to sunlight, X easily decomposes liberating a gas.

(i) Identify X and write its chemical formula.

.....

(ii) Write the balanced equation for the decomposition of X.

.....

(iii) In both acidic and basic media, X can behave as an oxidizing agent as well as a reducing agent. Write half ionic equations for the reduction of X in acidic medium and basic medium.

in acidic medium:

.....

in basic medium:

.....

(iv) Write balanced ionic equations for the reactions of X with the following compounds.

with Ag<sub>2</sub>O in acidic medium:

.....

with CrCl<sub>3</sub> in basic medium:

.....

(3.4 marks)

(b) (i) Explain the following statements giving reasons.

(I) Descending the group, the reactivity of alkali metals increases but the reactivity of halogens decreases.

.....

.....

.....

.....

(II) Though the first electron affinity of carbon is negative, the first electron affinity of nitrogen assumes a positive value.

.....  
.....  
.....  
.....

(III) In aqueous solution, LiH is basic whereas H<sub>2</sub>S is acidic.

.....  
.....  
.....  
.....

(IV) The melting point of V is much greater relative to that of Na.

3. One mole each of the gases carbon dioxide and hydrogen were mixed in a constant volume container and allowed to react as follows at the temperature 25 °C.

Some relevant thermochemical data at 25 °C are given in the following table.

Substance	$\Delta G_f^\ominus / \text{kJ mol}^{-1}$	$S^\ominus / \text{J mol}^{-1}\text{K}^{-1}$
CO(g)	- 137	197.5
CO <sub>2</sub> (g)	- 394	213.7
H <sub>2</sub> (g)	0	130.6
H <sub>2</sub> O(g)	- 229	188.7

- (i) Calculate  $\Delta G^\ominus$  of the above reaction at 25 °C.

.....  
 .....  
 .....

(1.2 marks)

- (ii) Calculate  $\Delta S^\ominus$  of the above reaction at 25 °C.

.....  
 .....  
 .....

(1.2 marks)

- (iii) Thereby, calculate  $\Delta H^\ominus$  of the above reaction.

.....  
 .....  
 .....

(1.2 marks)

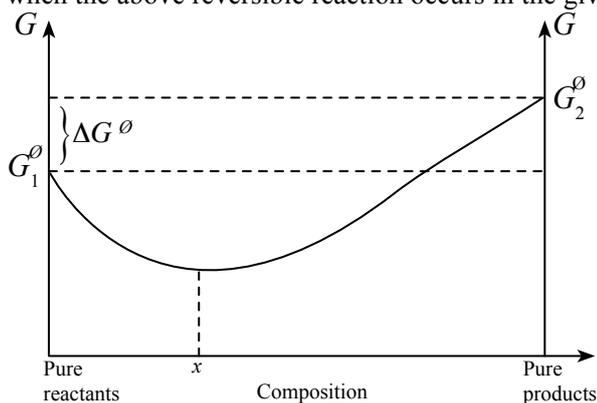

- (iv) Does the above reaction occur spontaneously in the direction given?

If the system has to be heated above a certain temperature  $T(\text{K})$  in order to make it spontaneously happen in the non spontaneous direction, calculate the value of  $T$ .

.....  
 .....  
 .....

(1.2 marks)

- The following graph illustrates how the Gibbs free energy varies with the composition of the reaction mixture when the above reversible reaction occurs in the given direction.

(v) What are the values of  $G_1^\ominus$  and  $G_2^\ominus$  ?

.....  
.....

**(0.4 marks)**

(vi) The change in Gibbs energy,  $\Delta G_r$  relevant to any composition of the reaction is given by the following relationship.

$$\Delta G_r = \Delta G^\ominus + 2.303 RT \log K$$

$K$  is the equilibrium constant.

When the system is in dynamic equilibrium deduce that,

$$\Delta G^\ominus = - 2.303 RT \log K$$

.....  
.....  
.....

**(0.8 marks)**

(vii) Calculate the equilibrium constant,  $K$  relevant to the above reaction at 25°C.

4. (a) A, B and C are three structural isomers of molecular formula  $C_5H_{13}N$ . Only B shows optical isomerism. When reacted with  $NaNO_2/HCl$  A, B and C, gave three structural isomers D, E and F respectively of molecular formula  $C_5H_{12}O$  of which E is optically active. When D, E and F were separately treated with the Lucas reagent ( $ZnCl_2 / conc. HCl$ ) a turbidity could be observed instantly with D and after about 5 minutes with E. F gave a slight turbidity after a long time. When heated with concentrated sulphuric acid, F did not give a hydrocarbon but D gave a mixture of two hydrocarbons G and H while E gave a mixture of two hydrocarbons G and I. G, H and I are structural isomers of molecular formula  $C_5H_{10}$ . G, H and I do not show geometrical isomerism. Draw the structures of A, B, C, D, E, F, G, H and I in the boxes given below. (Drawing stereoisomers is not required.)

A

B

C

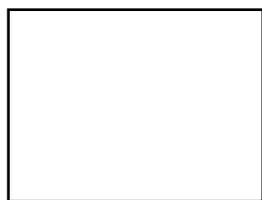

D

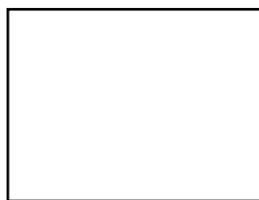

E

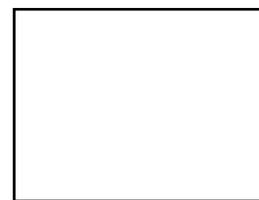

F

G

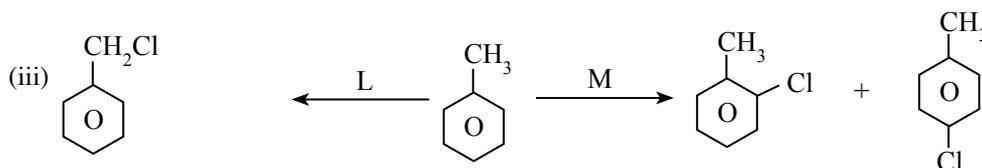

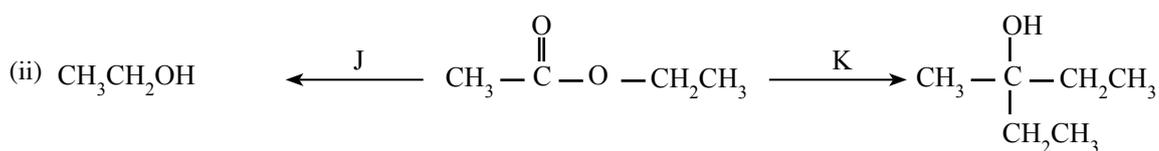

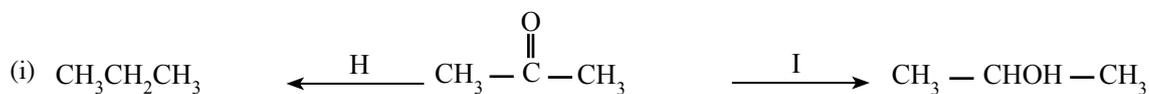

H

I

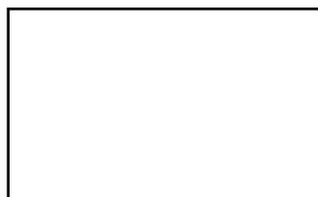

(3.6 marks)

- (b) In the boxes given, write the suitable reagent(s) / catalyst(s) (along with suitable conditions if any) H, I, J, K, L and M in the reactions indicated below.

H

I

J

K

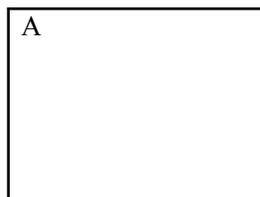

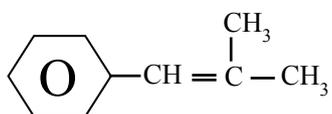

L

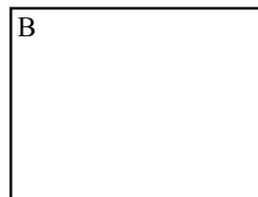

M

(2.4 marks)

- (c) (i) Draw in the boxes A and B, the structures of the products of the reaction of the following compound with HBr.

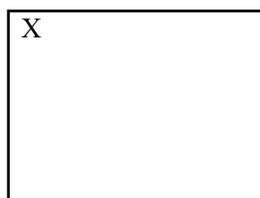

A

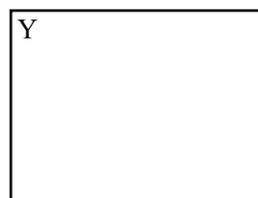

B

- (ii) Draw in the following boxes X and Y, the structures of the intermediate ions which give rise to the above products.

X

Y

- (iii) Of the ions drawn by you in (ii) above, which is the more stable?

.....

- (iv) Of the structures A and B drawn in (i) above, which is the major product?

.....

- (v) Hence, write the mechanism of the reaction leading to the formation of the major product.

(Total 10.0 marks)

**Part B - Essay**

Answer only **two** questions . Each question carries 15 marks.

5. (a) A rigid vessel contains the gas A under 27 °C and  $3.6 \times 10^5$  Pa pressure . Gas A partially dissociates as follows at temperatures above 200 °C.

This reaction occurs via the following two steps.

Though reaction I above occurs at temperatures above 100 °C, reaction II occurs only at temperatures above 200 °C.

The vessel containing the gas A above was heated to 227 °C and the system was allowed to attain equilibrium. The total equilibrium pressure was found to be  $1.0 \times 10^6$  Pa and at 227 °C the equilibrium constant relating to reaction II is 0.25.

- (i) Calculate the initial pressure of A at 227 °C before dissociation.
- (ii) Calculate the equilibrium partial pressures of A, B, C and P at 227 °C.
- (iii) When the temperature of the system was instantly decreased to 127 °C, the amounts of moles of P and Q remained unchanged and the total pressure became  $7.4 \times 10^5$  Pa. Calculate the partial pressure of P at 127 °C.
- (iv) Calculate the partial pressures of A, B and C at 127 °C before coming to the equilibrium.
- (v) Calculate the equilibrium partial pressures of A, B and C at 127 °C.
- (vi) Calculate  $K_p$  relating to equilibrium I at 127 °C.
- (vii) If  $K_p$  relating to equilibrium I at 227 °C is  $4 \times 10^5$  Pa, deduce the sign of  $\Delta H$  for the forward reaction.

**(7.5 marks)**

- (b) (i) Write Faraday's laws of electrolysis.
- (ii) State **three** main differences in the chemical process taking place in an electrochemical cell and an electrolytic cell.
- (iii) An electrolysis experiment was conducted by passing an electric current of 10 A for 1.0 h through  $1.0 \text{ dm}^3$  of a solution of  $0.5 \text{ mol dm}^{-3}$  HCl solution using inert electrodes.
- I. Write anodic reaction, cathodic reaction and overall reaction.
  - II. Draw a labeled sketch of the apparatus used for this experiment.
  - III. Write **two** observations you would make during the above experiment.
- (iv) Calculate the change in pH resulted at the end of the experiment. State the assumptions you made in your calculation if any.
- (v) If the above experiment was conducted in a closed system, comment on the change of entropy occurred in the system.
- (vi) At the end of the above experiment,  $1.0 \text{ dm}^3$  of a  $0.40 \text{ mol dm}^{-3}$  NaOH solution was added to the solution and electrolysis was repeated. Write the anodic reaction, cathodic reaction and the overall reaction that would take place at the outset of this experiment.
- (Faraday constant =  $96\,500 \text{ C mol}^{-1}$ )

**(7.5 marks)**

**(Total 15.0 marks)**

In order to find the order of the above reaction with respect to  $\text{FeCl}_3$  and  $\text{KI}$ , an experiment was designed using the solutions of following concentrations. Its results are given in the table below.

$\text{FeCl}_3$ concentration / $\text{mol dm}^{-3}$	$\text{KI}$ concentration / $\text{mol dm}^{-3}$	Rate of the reaction in relation to the formation of $\text{KI}_3$ (R) / $\text{mol dm}^{-3}\text{s}^{-1}$
(1) 0.01	0.02	0.08
(2) 0.01	0.04	0.16
(3) 0.02	0.02	0.16

- If R is the rate of formation of  $\text{KI}_3$  and  $R'$  is the rate of consumption of  $\text{FeCl}_3$ , write the relationship between R and  $R'$ .
- Calculate  $R'$  for (1) above.
- Calculate total order for the reaction.
- Calculate the rate constant at the relevant temperature.
- Explain briefly the method used to measure the time taken for the formation of a constant amount of  $\text{KI}_3$  when designing the above experiment.

(5.4 marks)

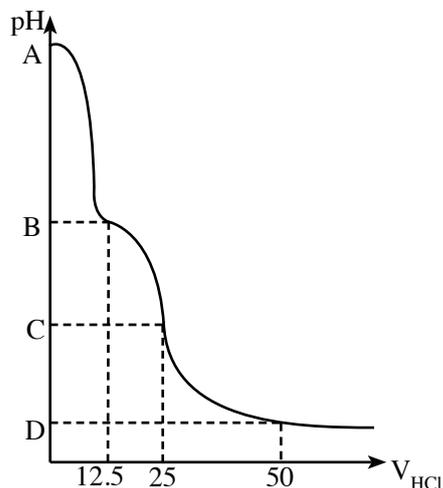

The above reaction is exothermic and its steps are as follows.

- Write the rate equation for the above reaction using the concentration terms of reactants.
- What is the rate determining step of the above multistep reaction?
- Find the order of the reaction with respect to the reactant  $\text{S}_2$ .
- Draw an energy profile for the mechanism of the above reaction.

(2.1 marks)

- Considering the dissociation of a monobasic weak acid HA in aqueous solution, derive an expression for its dissociation constant,  $K_a$ .
- Considering the hydrolysis reaction of the ion  $\text{A}^-$ , write an expression for the dissociation constant  $K_b$  of the base  $\text{A}^-$ .
- Obtain the relationship among  $K_a$ ,  $K_b$  and the ionic product of water  $K_w$ .
- 50.00  $\text{cm}^3$  of a 0.18  $\text{mol dm}^{-3}$  HCl solution were gradually added to 25.00  $\text{cm}^3$  of a 0.18  $\text{mol dm}^{-3}$   $\text{CH}_3\text{COONa}$  solution. The following graph sketches the variation of the pH of the medium during this addition.

Calculate the pH values corresponding to the points A, B, C and D in the graph.

$$K_a \text{ of } \text{CH}_3\text{COOH} = 1.8 \times 10^{-5} \text{ mol dm}^{-3}$$

$$K_w \text{ at } 25^\circ \text{C} = 1.0 \times 10^{-14} \text{ mol}^2 \text{ dm}^{-6}$$

(v) Consider the following aqueous solutions.

P  $\longrightarrow$   $0.1 \text{ mol dm}^{-3} \text{ CH}_3\text{COONa}$

Q  $\longrightarrow$  A solution containing equal volumes of  $0.1 \text{ mol dm}^{-3} \text{ CH}_3\text{COOH}$  and  $0.1 \text{ mol dm}^{-3} \text{ CH}_3\text{COONa}$

R  $\longrightarrow$  A solution containing equal volumes of  $0.1 \text{ mol dm}^{-3} \text{ CH}_3\text{COOH}$  and  $0.1 \text{ mol dm}^{-3} \text{ NaCl}$

S  $\longrightarrow$  A solution containing equal volumes of  $0.1 \text{ mol dm}^{-3} \text{ CH}_3\text{COOH}$  and  $0.1 \text{ mol dm}^{-3} \text{ HCl}$

Equal volumes of the above solutions are taken and to each of them  $1 \text{ cm}^3$  of a  $0.1 \text{ mol dm}^{-3} \text{ HCl}$  solution is added. Arrange the above solutions in the ascending order of the change in pH caused. Considering only the solutions Q and R, explain your answer referring to the graph.

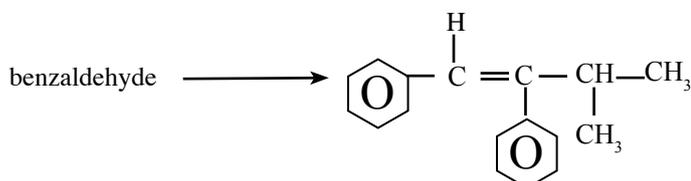

(7.5 marks)

(Total 15.0 marks)

7. (a) i. Though ethanol forms chloroethane with  $\text{PCl}_5$ , phenol does not form chlorobenzene with  $\text{PCl}_5$ .
- (I) To which category does the reaction of ethanol with  $\text{PCl}_5$  belong?
- (II) Explain the reasons why phenol does not show the above reaction.
- ii. Write the compounds  $\text{CH}_3\text{CH}_2\text{NH}_2$ ,  $\text{CH}_3\text{CH}_2\text{NHCH}_2\text{CH}_3$ ,  $\text{NH}_3$  and  $\text{C}_6\text{H}_5\text{NH}_2$  in the ascending order of their basicity. Give reasons for the proposed variation.

(4.0 marks)

(b) Indicate how the following conversion can be effected using only the given chemicals.

List of chemicals :

dilute  $\text{NaOH}$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{Zn/Hg}$  and  $\text{HCl}$ ,  $\text{H}_2\text{O}$ ,  $\text{CH}_3\text{CH}_2\text{CHO}$ ,  $\text{Mg}$ , dry ether,  $\text{PBr}_3$

(5.5 marks)

- (c) Indicate how the compound  $\text{CH}_3-\overset{\text{O}}{\parallel}{\text{C}}-\overset{\text{H}}{\text{N}}-\text{CH}_2\text{CH}_3$  can be synthesised through not more than six steps using ethyne as the only organic compound.

(3.5 marks)

- (d) Write the structures of all the products that would be formed when the compound  $\text{CH}_3\text{CH}_2\overset{\text{Br}}{\text{CH}}-\text{CH}_3$  is reacted with  $\text{CH}_3\text{ONa}$ .

Part C - Essay

Answer only **two** questions . Each question carries 15 marks.

8. (a) Consider the following reaction scheme. In it, the figures  represent solid substances,  solutions and  gases.

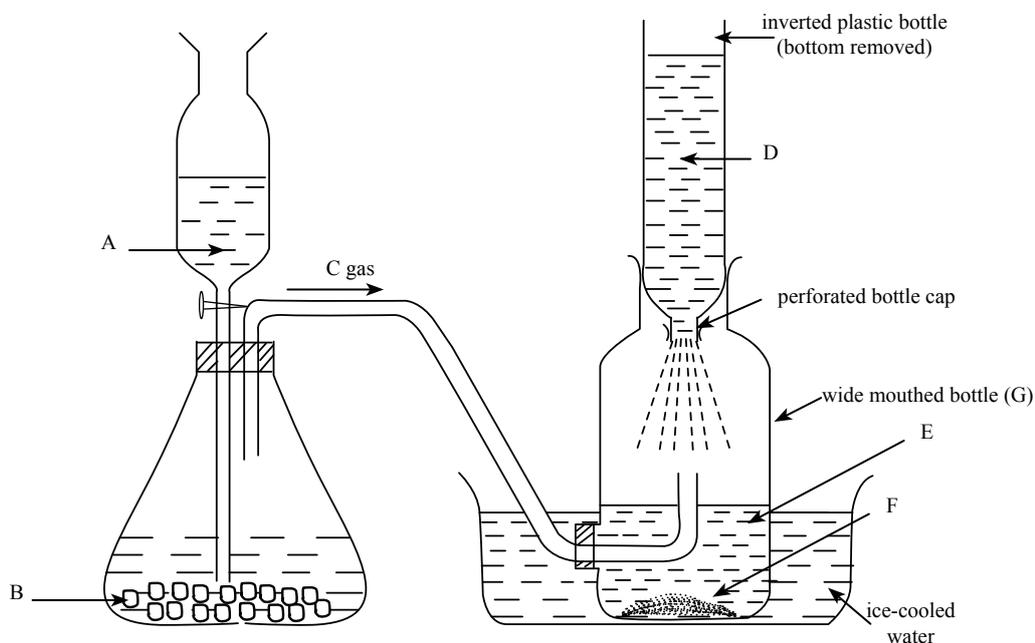

- Identify the species A, B, C, D, E, F, G, H, I, J and write their chemical formulae.
  - Write the balanced chemical equation for the reaction between D and a dilute NaOH solution.
  - Write the balanced ionic equation for the reaction between C and  $\text{K}_2\text{Cr}_2\text{O}_7$  in the presence of dilute HCl.
- (5.0 marks)**
- (b) When a solid salt Q giving lilac colour to the Bunsen Flame was thermally decomposed, a mixture of two dark coloured solid substances and a gas X were obtained. Addition of the above solid mixture to an alkaline aqueous solution gave a green solution (R) and a precipitate (W).
- Identify the salt Q.
  - Write the balanced chemical equation for the thermal decomposition of Q.
  - When the basicity of the solution R was reduced by adding an acid to it, the above precipitate W and the anion of Q were formed again. Write the balanced ionic equation relevant to this process. Also write the observations which you expect here.
  - The precipitate W was mixed with solid NaBr and acidified with dilute  $\text{H}_2\text{SO}_4$  . Stating what you expect to see here, write the balanced chemical equation for this reaction.
- (3.0 marks)**
- (c) S is an aqueous solution containing  $\text{FeSO}_3$  and  $\text{FeSO}_4$  . Solution T was prepared by mixing  $50.0 \text{ cm}^3$  of solution S with  $50.0 \text{ cm}^3$  of  $0.20 \text{ mol dm}^{-3} \text{ H}_2\text{O}_2$  solution.
- Excess of aqueous  $\text{BaCl}_2$  solution was added to exactly half of the solution T and the mass of the dried precipitate formed on this addition was  $0.5825 \text{ g}$ .
  - To the remainder of the solution T, excess KI solution was added and the volume of the  $0.40 \text{ mol dm}^{-3} \text{ Na}_2\text{S}_2\text{O}_3$  solution needed to react with the  $\text{I}_2$  released during this addition was  $20.00 \text{ cm}^3$ . (Ba = 137, S = 32, O = 16)

- (i) Write balanced ionic equations relating to all the reactions taking place in this experiment.
- (ii) Calculate the amount of moles of  $\text{BaSO}_4$  formed taking the amount of moles of  $\text{FeSO}_3$  as  $x$  and the amount of moles of  $\text{FeSO}_4$  as  $y$  in the solution S, and obtain a relationship for it in terms of  $x$  and  $y$ .
- (iii) Obtain an expression for the amount of moles of  $\text{H}_2\text{O}_2$  left in solution T in terms of  $x$  and  $y$ .
- (iv) Calculate the values of  $x$  and  $y$ .
- (v) Calculate separately the concentrations of  $\text{FeSO}_3$  and  $\text{FeSO}_4$  in solution S.

(7.0 marks)

(Total 15.0 marks)

9. (a) A kit of apparatus set up to demonstrate the process of the production of sodium carbonate by the Solvay process in the school laboratory is given below.

- (i) Name **two** substances which can be used as *A* and *B*.
- (ii) Name the **two** substances, excepting water, that can be used to prepare the solution labeled *D*.
- (iii) How does the method used in the Solvay process to produce the gas *C* using limestone as the raw material differ from that adopted in the above set up?
- (iv) Name the compound *F*.
- (v) Write balanced equations for the reactions happening inside the bottle *D*.
- (vi) Explain how each of the following contributes to increase the efficiency of the process.
  - I. Allowing solution *D* to percolate through tiny pores
  - II. Making solution *D* and gas *C* to flow in opposite directions as counter currents
  - III. Cooling the solution in the bottle *G*

- (vii) Write the balanced equation relevant to the production of the final product from the solid *F*.
- (viii) Give **two** uses of sodium carbonate.

- (ix) The following overall reaction indicates the initial reactants and the final products of the Solvay process.

According to this equation, calculate the atom economy of the Solvay process.

The atom economy of a process is defined by the following equation.

$$\text{Atom economy} = \frac{\text{Mass of the useful product}}{\text{Total mass of the reactants}} \times 100$$

$$(\text{C} = 12, \quad \text{O} = 16, \quad \text{Na} = 23, \quad \text{Cl} = 35.5, \quad \text{Ca} = 40)$$

- (x) As a parameter, what is the importance of atom economy in chemical industry?
- (xi) State a solid pollutant, a gaseous pollutant and a non – material pollutant that would be released to the environment during the Solvay process. Give one unfavourable effect that would be caused by each of them on the environment.

**(7.5 marks)**

- (b) The optimum composition of the atmosphere is important to maintain the balance in the environment for the sustainability of earth.

- (i) Name the **four** main components of dry air in the atmosphere and state their approximate percentage by volume.
- (ii) Name and inorganic gaseous substances that change the composition of dry air in the atmosphere and state one way of releasing each of them to the atmosphere.
- (iii) Name the environmental problems brought about by the inorganic gaseous substances you stated in part (ii) above.
- (iv) Explain in which way one environmental problem in (iii) above causes damage to marble constructions and metal structures.
- (v) State **two** impacts caused by the damages stated in (iv) above on environmental balance.
- (vi) State one gaseous substance that would be released to the atmosphere leading to environmental pollution by each of the following chemical industries and briefly explain a chemical course of action that would be taken to minimize their impact on environmental balance.
- I. Production of sulphuric acid by the contact process.
- II. Production of nitric acid by the Ostwald method.

**(7.5 marks)**

**(Total 15.0 marks)**

10. (a) M is an element belonging to 3d series. The common salts of M show a pink colour in aqueous solutions but turns blue on addition of concentrated hydrochloric acid.

- (i) Identify M.
- (ii) Write the electron configuration of an atom of M in the ground state using the common notation  $1s^2, 2s^2$  .....
- (iii) What are the main oxidation states of M in the compounds it forms?
- (iv) Using the formulae of the complex ions responsible for the respective colours, write the ionic equation relevant to the aforesaid colour change taking place on addition of concentrated hydrochloric acid to a solution of a salt of M.
- (v) Formulae of two compounds with a complex cation formed by M are as follows.

A

B

- I. Write the IUPAC names of compounds A and B.
  - II. What is the shape around the metal atom in the cations of A and B?
  - III. If you are provided with two equimolar, dilute solutions of A and B and a  $0.1 \text{ mol dm}^{-3}$  silver nitrate solution, explain briefly how you distinguish A and B.
- (vi) Draw the structure of the cation formed by the replacement of all the water molecules in cation A by 1, 2 - diaminoethane. You should also show the charge of the ion.

1, 2 - diaminoethane.

- (vii) Suggest a method to obtain a pure sample of metal M from an alloy consisting of M and copper. **(7.5 marks)**

(b) A solution has been prepared by dissolving 1.42 g of  $Na_2SO_4$  and 1.50 g of NaI in water and diluting to  $2.50 \text{ dm}^3$ .

$$(Na = 23, S=32, O=16, Pb=207, N=14, I = 127)$$

$$K_{sp} [PbI_2] = 1.6 \times 10^{-9} \text{ mol}^3 \text{ dm}^{-9}$$

$$K_{sp} [PbSO_4] = 1.6 \times 10^{-8} \text{ mol}^2 \text{ dm}^{-6}$$

- (i) Calculate the concentration of  $Na^+$ ,  $I^-$ , and  $SO_4^{2-}$  ions in the above solution.
- (ii) By calculation show which compound precipitates first when a  $Pb(NO_3)_2$  solution is gradually added to the above solution.
- (iii) What is the minimum mass of  $Pb(NO_3)_2$  that should be added to the above solution in order to observe the precipitation of the above compound?
- (iv) Show that any other compound does not precipitate even when  $Pb(NO_3)_2$  is added to the solution till the  $Pb^{2+}$  ion concentration is double the value of that in (iii) above and calculate the mass of the initial compound that has precipitated at this instant?
- (v) Calculate the minimum mass of  $Pb(NO_3)_2$  that should be added to precipitate all the ions in the solution which can be precipitated.
- (vi) State two assumptions you made in the above calculations.

**(7.5 marks)**

**(15.0 marks)**
